January 28, 2015

Representative Frank Kotowski
Health, Human Services & Elderly Affairs Committee
New Hampshire House of Representatives

Dear Chairman Kotowski:

Thank you for the opportunity to provide some comments regarding New Hampshire’s certificate-of-need (CON) program. The Project for the Study of American Capitalism at the Mercatus Center at George Mason University is dedicated to advancing knowledge about the effects of government-granted privilege on society. As part of its mission, the program conducts careful and independent analyses that employ economic and legal scholarship to assess legislation, regulation, and taxation from the perspective of the public interest. Therefore, this commentary does not represent the views of any particular affected party but is designed to assist your Committee as it explores these issues.

Attached, please find a research brief by George Mason University economist and Mercatus Center Scholar Thomas Stratmann and me about the effects of CON regulations on the provision of health care services in the state of New Hampshire. Our findings show that continued application of New Hampshire’s CON program, and its restrictions on the provision of health care services within the state, limits the choices available for those seeking quality care. In particular, using the general findings from recent research by Thomas Stratmann and Jacob Russ,1 we estimate that continued application of the state’s CON program has reduced the provision of health care services in the following ways:

- 1,300 fewer hospital beds,
- 7 fewer hospitals offering MRI services, and
- 9 fewer hospitals offering CT scans.

Moreover, while New Hampshire’s CON program may have been initially intended to control costs and increase care for the poor, recent research has demonstrated that these goals have never been achieved through CON regulations. There is little evidence to support the claim that certificates of need are an effective cost-control measure, and Stratmann and Russ have found that these programs have no effect on the level of charity care provided to the poor. While controlling health care costs and increasing care for the poor may laudable public policy goals, the evidence is strong that CON regulations are not an effective tool for doing so. Instead, these programs simply decrease the supply and availability of health care services by limiting entry and competition.

---

Thank you for giving me the opportunity to provide comments regarding the history and effects of New Hampshire’s certificate-of-need regulations. As we note in the attached paper, this is an opportunity for policymakers in New Hampshire to reverse the course and open the health care market for greater entry, more competition, and ultimately greater choice for those seeking care.

Sincerely,

Christopher Koopman
Research Fellow, Project for the Study of American Capitalism
Mercatus Center at George Mason University
Christopher Koopman and Thomas Stratmann
January 2015

Thirty-five states and the District of Columbia currently limit entry or expansion of health care facilities through certificate-of-need (CON) programs.1 These programs prohibit health care providers from entering new markets or making changes to their existing capacity without first gaining the approval of state regulators. Since 1979, New Hampshire has been among the states that restrict the supply of health care in this way, with 12 devices and services—ranging from magnetic resonance imaging (MRI) scanners to open heart surgery to psychiatric services—requiring a certificate of need from the state before the device may be purchased or the service may be offered.2

CON restrictions are in addition to the standard licensing and training requirements for medical professionals, but are neither designed nor intended to ensure public health or ensure that medical professionals have the necessary qualifications to do their jobs. Instead, CON laws are specifically designed to limit the supply of health care, and are traditionally justified with the claim that they reduce and control health care costs.3 The theory is that by restricting market entry and expansion, states might reduce overinvestment in facilities and equipment. In addition, many states—including New Hampshire—justify CON programs as a way to cross-subsidize health care for the poor. Under these charity care requirements, providers that receive a certificate of need are typically required to increase the amount of care they provide to the poor. In effect, these programs intend to create quid pro quo arrangements: state governments restrict competition, increasing the cost of health care for some, and in return medical providers use these contrived profits to increase the care they provide to the poor.4

However, these claimed benefits have failed to materialize as intended. Recent research by Thomas Stratmann and Jacob Russ demonstrates that there is
no relationship between CON programs and increased access to health care for the poor. There are, however, serious consequences for states continuing to enforce CON regulations. In particular, in New Hampshire these programs result in approximately 1,300 fewer hospital beds, seven fewer hospitals offering MRI services, and nine fewer hospitals offering computed tomography (CT) scans. For those seeking quality health care in New Hampshire, this means less competition and fewer choices, without increased access to care for the poor.

THE RISE OF CON PROGRAMS

CON programs were first adopted by New York in 1964 as a way to strengthen regional health planning programs. Over the following 10 years, 23 more states adopted CON programs. Many of these programs were initiated as “Section 1122” programs, which were federally funded programs providing Medicare and Medicaid reimbursement for certain approved capital expenditures. The passage of the National Health Planning and Resources Development Act of 1974, which made certain federal funds contingent on the enactment of CON programs, provided a strong incentive to states to implement these programs. New Hampshire enacted its first CON program in 1979. By 1982, just eight years later, every state except Louisiana had some form of a CON program.

In 1987, the federal government repealed its CON program mandate when the ineffectiveness of CON regulations as a cost-control measure became clear. Twelve states rapidly followed suit and repealed their certificate-of-need laws in the 1980s. By 2000, Indiana, North Dakota, and Pennsylvania had also repealed their CON programs. Since 2000, Wisconsin has been the only state to repeal its program.

New Hampshire remains among the 36 states, along with the District of Columbia, that continue to limit entry and expansion within their respective health care markets through certificates of need. On average, states with CON programs regulate 14 different services, devices, services.
and procedures. New Hampshire’s CON program currently regulates 12, less than the average. As figure 1 demonstrates, New Hampshire ranks as the 27th most restrictive state given its number of certificate-of-need regulations.

**DO CON PROGRAMS CONTROL COSTS AND INCREASE ACCESS TO CARE FOR THE POOR?**

Many early studies of CON programs found that these programs fail to reduce investment by hospitals.9 These early studies also found that the programs fail to control costs.10 Such findings contributed to the federal repeal of CON requirements. Since then, more recent research into the effectiveness of remaining CON programs as a cost-control measure has been mixed. While some studies find that CON regulations may have some limited cost-control effect,11 others find that strict CON programs may in fact increase costs by 5 percent.12 The latter finding is not surprising, given that CON programs restrict competition and reduce the available supply of regulated services.

While there is little evidence to support the claim that certificates of need are an effective cost-control measure, many states continue to justify these programs using the rationale that they increase the provision of health care for the poor. To achieve this, 14 states—including New Hampshire—include some requirement for charity care within their respective CON programs.13 This is what economists have come to understand as a “cross-subsidy.”14

The theory behind cross-subsidization through these programs is straightforward. By limiting the number of providers that can enter a particular practice and by limiting the expansion of incumbent providers, CON regulations effectively give a limited monopoly privilege to providers that receive approval in the form of a certificate of need. Approved providers are therefore able to charge higher prices than would be possible under truly competitive conditions. As a result, it is hoped that providers will use their enhanced profits to cover the losses from providing otherwise unprofitable, uncompensated care to the poor. In effect, those who can pay are charged higher prices to subsidize those who cannot.

In reality, however, this cross-subsidization is not occurring. While early studies found some evidence of cross-subsidization among hospitals and nursing homes,15 the more recent academic literature does not show this cross-subsidy taking place. The most comprehensive empirical study to date, conducted by Thomas Stratmann and Jacob Russ, finds no relationship between certificates of need and the level of charity care.16

**THE LASTING EFFECTS OF NEW HAMPSHIRE’S CON PROGRAM**

While certificates of need are neither controlling costs nor increasing charity care, they continue to have lasting effects on the provision of health care services both in New Hampshire and in the other states that continue to require them. However, these effects have largely come in the form of decreased availability of services and lower hospital capacity.

In particular, Stratmann and Russ present several striking findings regarding the provision of health care in states implementing CON programs. First, CON programs are correlated with fewer hospital beds.17 Throughout the United States there are approximately 362 beds per 100,000 persons. However, in states with a CON program, they find 99 fewer beds per 100,000 persons than the national average. In the context of New Hampshire, with its population of approximately 1.3 million, this means that there are about 1,300 fewer hospital beds as a result of the state’s CON program.

Moreover, several basic health care services that are used for a variety of purposes are limited because of New Hampshire’s CON program. Across the United States, an average of six hospitals per 500,000 persons offer MRI services. In states such as New Hampshire that regulate the number of hospitals with MRI machines, the number of hospital that offer MRIs is reduced by 2.5 hospitals per 500,000 persons.18 As a result, in New Hampshire there are approximately seven fewer hospitals offering MRI services. New Hampshire’s CON program also affects the availability of CT services. While an average of nine hospitals per 500,000 persons offer CT scans, CON regulations are associated with a 37 percent decrease in these services. For New Hampshire, and its population of approximately 1.3 million, this could mean that about nine fewer hospitals offer CT scans.

**CONCLUSION**

While CON programs were intended to limit the supply of health care services within a state, proponents claim that the limits were necessary to either control costs
or increase the amount of charity care being provided. However, 40 years of evidence demonstrate that these programs do not achieve their intended outcomes, but rather decrease the supply and availability of health care services by limiting entry and competition. For policymakers in New Hampshire, this situation presents an opportunity to reverse course and open the market for greater entry, more competition, and ultimately more options for those seeking care.
